An Introduction to Illustrator

Creating A Document & Understanding Artboards

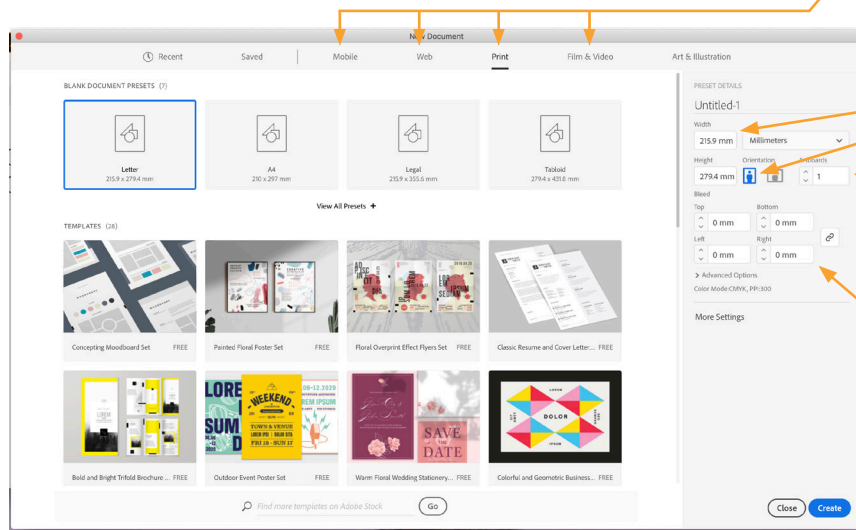

Step 1.

Open up Illustrator. In the dialogue box that appears select **'Create New'**.

Step 2.

This will bring up the dialogue box below. Read the notes to get an understanding of what each section means and how it affects the document you are creating.

The options along the top state if you are designing for 'Print', 'Web' or 'Mobile'. Make sure you have 'Print' selected then standard paper sizes will be listed as thumbnails underneath.

Here is the size of the artboard you are going to create. This is set at standard letter size with portrait orientation. Don't worry about this too much as you can change it at a later stage.

Here you can dictate how many artboards you would like. Don't worry about this at this stage as you can add more once your document is open.

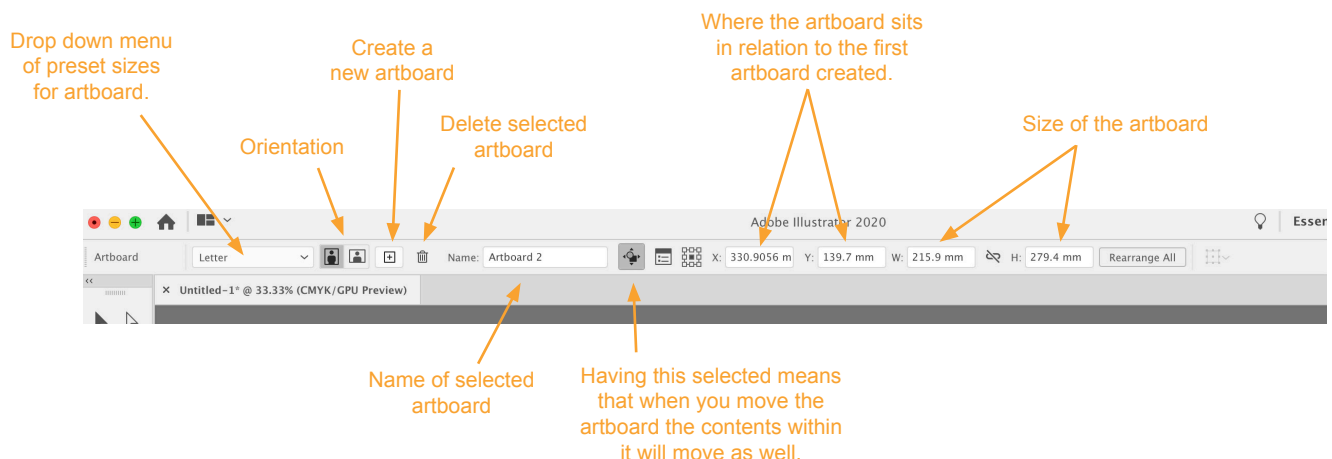

Just like InDesign you can add bleed to your artboards. This is only important if you are sending your work straight to printers. Don't worry about this at this stage, but feel free to email me any questions about this.

Step 3.

Now your document has opened. Note the white space in the middle is called your **artboard**. You should use this space for all your design work and the surrounding grey space for your rough workings.

Step 4.

Click **Shift O**, this will activate your **'Artboard Tool'**. Notice the menu along your top tool bar change. See below for an explanation of the different functions available.

Understanding The Set Up

Tip:
You can click the top right arrows to expand and collapse your palettes.

Workspaces

Just like with InDesign, we need to make sure we are working with the same interface.

This time go to **Window - Workspace** and make sure **'Essentials Classic'** is ticked. Then go to **Window - Workspace** again and click **'Reset Essentials Classic'**.

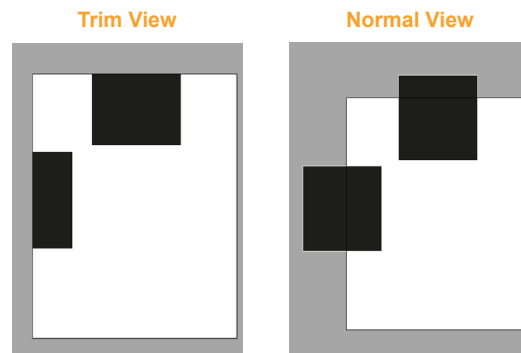

This drop down menu works just the same as InDesign, so if you are ever missing a palette you can find it here.

Different View Options

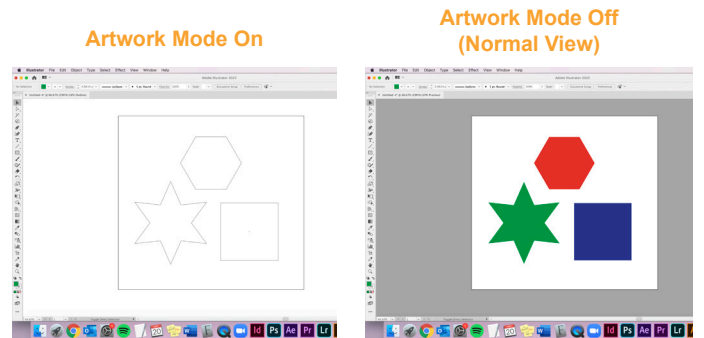

Trim View

Trim view allows you to view your artwork cropped to the artboard size. This is a more realistic view of how your final artwork will look. To find this go to **View - Trim View** and you can click it to turn it on and off.

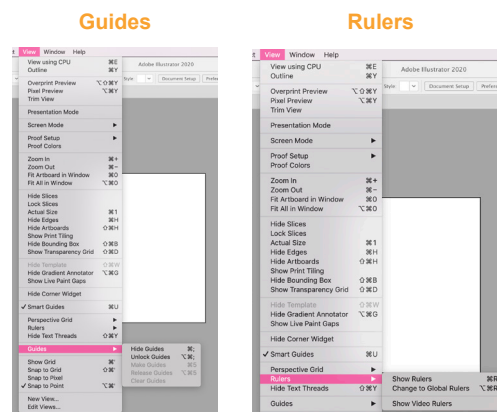

Artwork Mode

When working on more complex pieces, it may be useful to just view the outlines of your shapes. To do this hold down **Cmd (or Ctrl) Y**. To resume back to normal view click **Cmd Y (or Ctrl)** again.

Guides and Rulers

In the **View** drop down menu you can also **show/hide your rulers and guides**. Rulers appear around the outside of your working space and you can create guides by **click and dragging on the ruler**.

Drawing & Aligning Shapes

Drawing Shapes

Step 1.

Right click on the 'Rectangle Tool' from your toolbar on the left. This should bring up a menu of alternative shapes.

Tip:

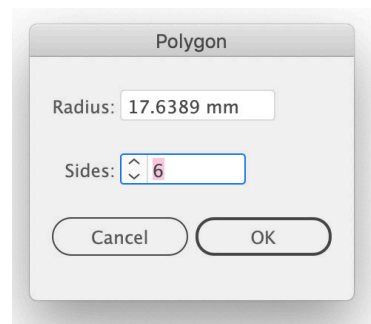

You can do the same process with any of the other shape tools if you wish to dictate accurate sizes. Alternatively you can select the tool and then **drag and drop your cursor** on your artboard to free draw the shape.

Step 2.

Select 'Polygon Tool'. Move your cursor onto your artboard and click once. This should bring up the dialogue box below.

Step 3.

Here you can dictate the features of your polygon. Click OK and your shape will appear.

The Align Tool

Tip:

You can group objects by selecting all objects and right clicking group. To ungroup, right click - ungroup.

Step 1.

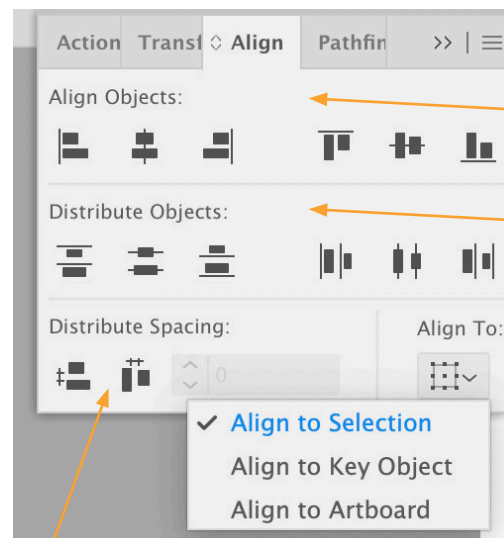

Create around 3-4 different shapes using the process outlined above.

Step 2.

Open up your 'Align' palette from the right hand side. If you can't see it open it up from the Window drop down menu.

Step 3.

Experiment with the different functions. To apply a function you must select the shapes you wish to apply them to. The drop down menu at the bottom right allows you to choose where you align them to.

This row aligns your objects to the specified side.

This row will evenly space your object as shown.

This row dictates the distance between two objects.

For this option to work you have to have the objects selected then click 'Align to Key Object' from the drop down menu. Then click on the object you wish to base your spacing from, it should highlight blue. You can specify the spacing in the box.

Introduction To The Pen Tool

Tip:

Try moving an anchor point and then pull out one of the handles. Have a play with these to get an understanding of what their roles are.

Anchors and Handles

Draw a shape e.g. a circle, then choose your 'Direct Selection Tool' from your tool bar on the left hand side. Drag and drop your cursor over the shape to select it. You will see something like this. You should be aware that the square points are known as **anchors** and the lines either side are **handles**.

Drawing A Right Angled Shape

1. Select the pen tool, click once on your artboard to draw your first anchor point.
2. Hold down shift, move your cursor to the right, click to drop another anchor point. A horizontal line should now appear.
3. Keeping shift down, move your cursor down, you will see the handle change direction to 90 degree south. You can now drop another anchor point.
4. **Holding down shift ensures your angle is kept to a 45 degree.** Try and create the shape shown below.

Drawing A Shape With Different Angles

1. Select the pen tool, click once on your artboard to draw your first anchor point.
2. Move your cursor around and you will see you handle move in all directions. This is because you are **no longer holding down shift the angle is free.**
3. You can then choose to place your anchor point anywhere you wish.
4. Try making a fun shape. Notice when you come to complete your shape a little circle will appear next to your cursor. This shows you are finishing where you started.

Drawing a curved line

1. Select the pen tool, click, **hold** and drag to see your handles move side to side. This is dictating your **angle**. Decide on an angle then release your click.
2. You are then deciding where to put your next **anchor point**. Release you click to drop point.
3. Now click you direct selection tool and select the blue circle at the end of your handle line. You can now move this and see how it changes you the angle of you line

Drawing an even curved line

1. Select the pen tool, **click and hold**, whilst also holding down **shift**. Move your handle vertically up. This is dictating your angle. Release your cursor and shift.
2. Move your cursor to the right to position your second anchor point.
3. **Click and hold** to drop your anchor point and then drag your handle vertically down. Try and make your handles approximately the same length to create an even curve

Formatting Your Shapes

Stroke and Fill

Experiment with the palettes below using the shapes you have already created. Make sure the shape you are wanting to edit is **selected** before making your alterations.

Note: **Stroke** is just another word for outline.

The box with the **open fill** dictates your **fill colour** (white box). The **box with the boxes inside** dictates your **stroke colour** (black box). You can click between the two, which ever is at the front is the colour you are changing.

Hold shift to select multiple swatches within the palette. You can click this button to put them into a group.

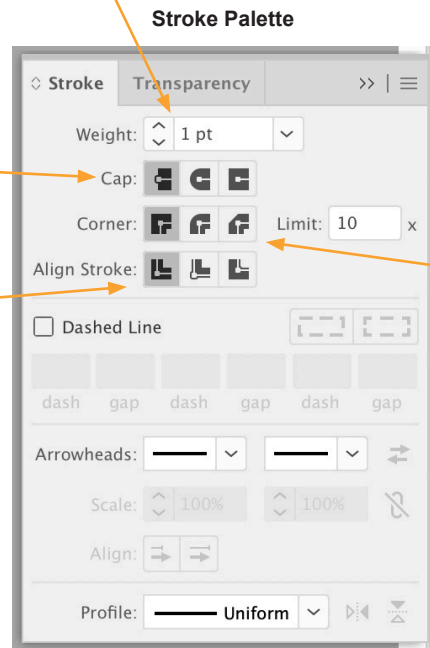

Click this to create a new swatch where you can alter the sliders as shown in the InDesign tutorial.

Drag swatches to the bin to delete them.

This effects the heaviness of the stroke.

How the end of a line will appear.

Where the stroke sits in relation to your anchor points.

How right angled corners will appear.

Pathfinder Palette

You can also have a go with the **Pathfinder Palette**. This is a highly used tool by illustrators as it allows you to cut and merge your shapes.

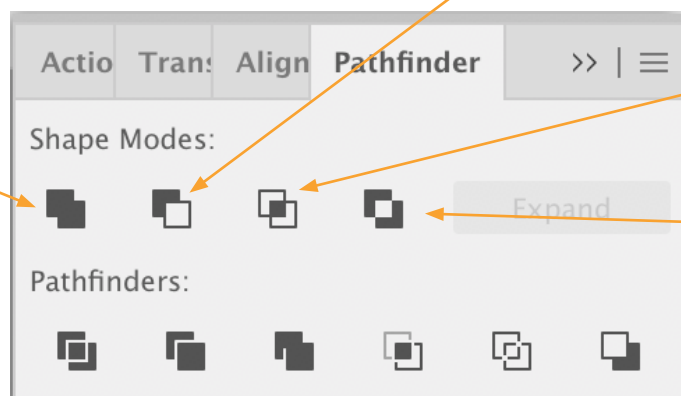

You will need to move you shapes in-front and behind each to use this function. To do this, select the shapes - **right click - arrange...**, alternatively look at the **shortcut sheet** for Illustrator (p.10).

Intersect
Creates a shape from the overlapping section of the shapes.

Exclude

Unite
Combine all selected objects into a single shape.

Image Trace

Image Trace allows you to convert your hand drawn sketch on paper to an editable shape in Illustrator.

Step 1.

Hand draw your sketch onto paper.

Step 2.

Ideally scan it into your computer. Select the black and white option and 300dpi (resolution) if you can. If you don't have a scanner you can use your phone to photograph your sketch. Try and get it as high quality as you can with good lighting.

Step 3.

Once scanned in. Open an Illustrator document and then drag and drop your scan from Finder/Computer documents into Illustrator.

Step 4.

With your scan selected, this should bring up a new tool bar along the top. Select **'Image Trace'**. If this bar does not appear, you can find Image Trace by looking in you Window drop down menu.

Step 5.

If you are following the top tool bar, you now need to click the **'Image Trace Panel' icon**. This will bring up a separate palette.

Step 6.

You can now alter the settings as to how your image is traced. Have a play with the sliders to see which work best for your drawing and the outcome you would like. The **'Preset'** drop down is useful as it can help guide you depending on the artwork you have dropped in. Also, ticking the **'Ignore White'** option can be useful if you are planning to edit the work.

Step 7.

Once you are happy with the settings you have dictated, you can click **'Expand'** in the top tool bar to make it an editable shape. You can then change the fill and stroke colours as we did previously. Watch the **'Introduction to Illustrator' video** for more detailed instructions.

Saving & Exporting

Saving

1. File - Save As.

2. Give it a name.

3. Locate where you would like to save your file.

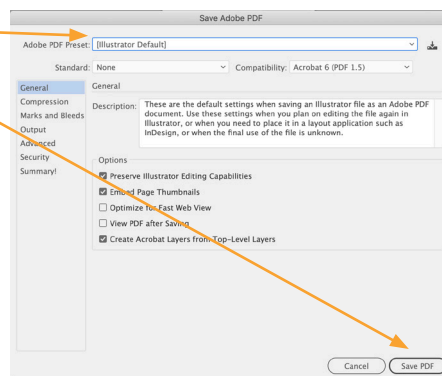

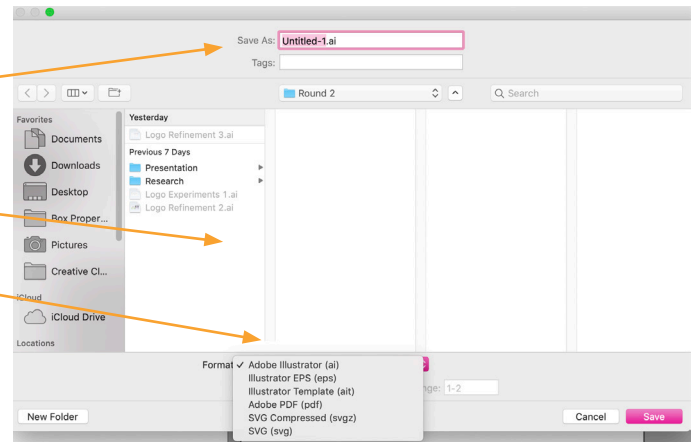

4. Select which format you would like.

Note Adobe PDFs are located here whereas in InDesign they are in the export options.

5. Click 'Save'.

6. For simple proofs the Illustrator default PDF preset is fine so you can click 'Save PDF'.

7. If you are saving PDFs make sure to save an ai file as well as you cannot go back and easily edit your PDFs.

In the options here you can select specific artboards you wish to export or you can select 'All'

Exporting

The most common export options in Illustrator are PNGs and JPEGs. They both export your artwork as flat visuals. JPEGs can be either digital (RGB or CMYK) but PNGs can only be exported for RGB. PNGs can allow your artwork to be transparent if you select this option whilst exporting.

To Export a **transparent PNG**, follow the steps below:

1. File - Export As.

2. Give it a name.

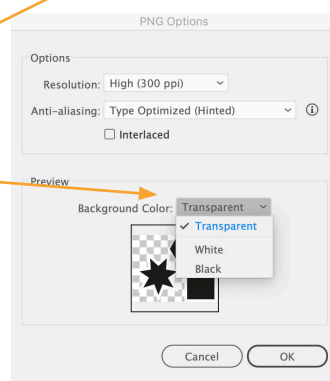

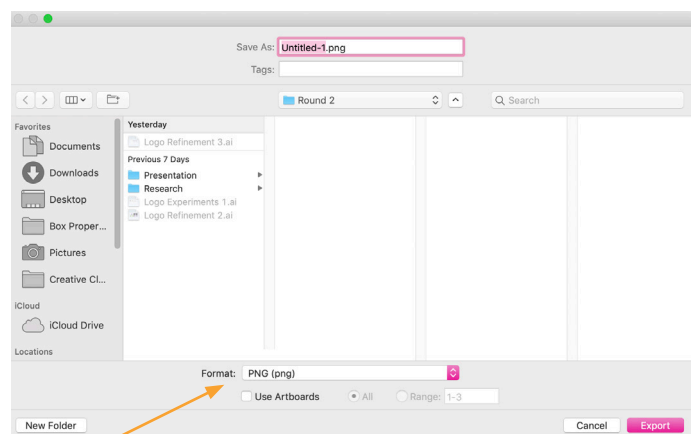

3. Locate where you would like to save your file.

4. Open up the Format menu and select PNG (png).

5. Click Export.

6. A new dialogue box will open - Select Transparent from the 'Background Colour' drop down menu.

7. Click Ok.
